# 1. Introduction

The primary aim of this document is to gain an understanding of WebRTC (Real Time Communication). How and why is it being developed? The potential benefits of real time communication and the effects it will have on the trillion dollar telecommunications industry. It will look at the organisations developing WebRTC and those which will set the standards for developers and users alike. The document will investigate the required components of WebRTC and how and when it will be deployed as standard. The document will also review the commercial opportunities and take a look and the future possibilities of WebRTC.

As WebRTC is still in the process of having standards and protocols ratified, this document will require regular updates.
